AI insight

Storage is tight mainly because of videos and app caches. 11.4 GB of temporary data can be cleaned safely right now.

What it does

- Storage map

See which folders take the space and drill into any of them.

Duplicates

Matched by file size and content hash, not by filename.

Startup apps

See what launches with Windows and switch items off.
- Safe cleanup

Temporary files and caches only. Personal files are never removed automatically.

Drive health

SMART and NVMe readings, reported only when the drive provides them.

Battery health

Current capacity against design capacity, and cycle count where available.
- Large files

Find files over 100 MB, 1 GB, or any size you set.

Performance

CPU, memory, GPU, disk and network, with the process behind each spike.

Local AI

Plain-language answers from an offline model. It suggests; you approve.

Everything stays on this device.

No account. No cloud. No telemetry. Works fully offline on Windows 10 and 11 (x64). The AI model is optional and runs locally.
